Managing I/O Bottlenecks: 21 tips and best practices on writing efficient programs While program architecture and design are essential to efficiently addressing performance bottlenecks within each Linux application, it's also important to understand these bottlenecks as they apply to the larger I/O transactions within the Linux operating system. On SYS-CON Events' blog, John Cobb and Matt Fry discuss strategies for overcoming various I/O bottlenecks in software that is deployed within the operating systems. And while they do start with best practices for improving application performance, their discussion is supplemented with a series of practical tips for improving performance, including the use of `mmap` and `inotify`, opening only once, and using fast inode fields. This is especially pertinent for our event-driven, two-phase embedded applications that typically run out of memory, and so have to re-use temporary working memory. Fortunately, embedded developers already have the tools and processes that can help them address such problems: The first tip is to move your I/O operations into a worker thread rather than the application thread. This can, in turn, be implemented by creating a new thread with the `mtx_lock_t` mutex (according to the man page, Linux 2.4 has a `useconds` mutex, which is also useful for some operations), and providing thread-specific data to the new thread. The second tip is to use "background" I/O-processing threads, as these can use the core's I/O scheduling priorities to give high priority to the operations they are processing. As the authors point out, `inotify` (event notification API) is best used for this purpose, and is, itself, also an example of this strategy. One thing that always comes up in discussions of programming in Linux is that of resources and fairness. Resource management is a big focus in embedded systems, and is also related to the discussion of `inotify`-based I/O notification. In particular, in his blog, Mr. Cobb has an excellent entry on resource management, that is well-researched and carefully written: The best resource management strategy for an embedded device is to ensure that the device has enough resources that it can perform its required tasks with priority. In other words, you'd want to avoid hard coding data sizes for code, memory allocation for data, and the

What's New In Adobe Photoshop CC 2019?

The Healing Brush is a tool which finds pixels that are similar to the pixels in the region you select. The Smudge Tool allows you to move the pixels around to blend one layer on top of another. The Liquify tool allows you to stretch and squash an area of the image without distorting it. The Pen tool is a vector based tool that is used to draw freeform paths. These paths can then be moved, rotated, or scaled, much like drawing with a paintbrush. The Selection Brush is used to make selections of portions of an image. The Color Picker is used to change the color of any part of the image. It can be used to quickly change colors in large areas or fine details. The Adjustment Brush allows you to paint on any area of your image to change the brightness, contrast, saturation, or hue and remove unwanted elements. You can also apply a gradient, a layer style, or a filter to the image. The Gradient Tool is used to create and apply gradual changes in color. It's especially useful when creating transitions between layers. The Gradient Swatch Tool is used to create Gradient Swatches for use with the Gradient Tool. The Brush tool is used to paint in an area of the image. You can then refine the area by scrubbing on the brush. You can use the "scatter" technique to achieve a variety of effects. For example, you can create clumps of paint by using the Scatter tool. You can also set a mask around your brush and apply the paint selectively. You can use the "dodge" technique to simulate light coming from behind and behind light sources. The "burn" technique can be used to create a more dramatic effect. The "dodge" and "burn" tools are great for softening and hardening a specific area of the image. The Histogram tool is used to see what areas of the image look brighter or darker. The Dodge tool is used to darken an area of the image. The Burn tool is used to lighten an area of the image. The Fire tool is used to add a pattern or texture to an area of the image. The Sponge tool is used to apply a layer style based on a brush or a path. Layer styles can also be modified by using the Sponge tool. The Eraser tool is used to remove unwanted areas of the image. The Clone Stamp tool can be used to duplicate an
